The history and progress of diesel generator sets cannot be told without Nippon Sharyo, Ltd. We have defined the times by launching various power production facilities with new innovative concepts. We continue to contribute to the environment and ergonomics through improving our products.

1960

First generator developed

Development of DG model generator (Japan's first portable diesel generator for construction, September 1960)

Thanks to customers support, we have been successful for more than half a century in many locations of the world.

Both voltages, 200 V and 400 V, are available.

High insulation + alternator

The alternator winding is coated with varnish using dripping impregnation and vacuum impregnation to provide high insulation performance.

Weather resistant coating

Electrodeposition and weather-resistant baking finish are used on all models, providing high resistance to corrosion.

High-quality power supply

The FET-type AVR (Automatic Voltage Regulator) and high-performance damper winding provide high-quality power with a voltage regulation of $\pm 0.5\%$.

In addition to working well with general linear loads, the generator also works well with non-linear loads such as inverters.

Tough and durable

Toughness and durability. We continue to create products that satisfy our customers.

Generators developed by NISSHA

All NISSHA generators, except for engine components, are developed and manufactured according to our designs.

In particular, we have absolute confidence in our alternators due to our many years of experience.

We will continue to respond to our customer's requests so that they can supply power to a wide variety of loads.

OPTION

Full-auto parallel running device

This controller includes auto start/stop, synchronizing, load sharing, controlling the number of operating units, and measurement and protection, allowing fully automatic parallel running of generators. The number of operating generators are automatically controlled so that the optimum number are in operation according to changes in the power load, therefore only the minimum necessary number of generators are in operation and the remaining generators are stopped and placed in a standby state, thus improving the operating efficiency of the generators and saving fuel.

Features

- Compact unit that enables all-in-one control
- Full automatic control with a single switch
- Efficient operation for lower fuel consumption
- Up to 8 generators can be connected
- Remote auto start-stop of one or more generators via contact input (can be applied as standard emergency generator for power failures)

▲ Front panel

Functions

- 1 Auto start/stop
- 2 Auto synchronizing, load sharing
- 3 Control for constant frequency and voltage
- 4 Auto control of the number of operating units

Parallel running and disconnection are automatically controlled to run the optimum number of units according to changes in load power. (Generators are controlled by communications cables. Standard length of cables is 10m, with optional 99m cables available.)

- 5 Control for heavy loads

The number of operating units can be increased in advance with a forced operation command, allowing heavy load equipment such as vibratory pile drivers, earth augers and tunnel excavators to be connected.

- 6 Remote control of auto start/stop

Each generator can be controlled remotely. Various control methods are available.

- 7 Provided with reverse power protection and measurement display

Notes on parallel running

Although parallel running involves procedures such as load sharing, as well as monitoring the operation state, it offers a number of benefits:

- Allows large power supply.
- The number of operating units can be easily set according to the load demand.
- Even if one generator fails, operation can be continued with other units.

Furthermore, an advanced power generation system can be built by controlling the number of operating units and using the remote start/stop.

	Start/stop	Synchronizing	Load sharing	No. of operating units	Remote control
Full-auto parallel running	Auto	Auto	Auto	Auto	Option
Manual synchronizing	Manual	Manual	Manual	Manual	Option

Note: This table shows the basic functions of parallel running.

Caution

There are limitation of capacity depending on use. For details, please consult Nippon Sharyo.

AMF system

Although the NES series portable generators are basically designed to provide power supply at work sites, options are available for use as AMF generators that automatically supply power in the event of a power failure. These options include the auto start/stop unit, battery charger and power switching panel, and an AMF generator can be configured using simple optional equipment.

Auto start/stop unit

This unit automatically starts/stops a generator according to the commercial power state. The generator starts automatically when commercial power fails, and stops automatically after cooling down when commercial power is restored.

The unit is provided with an auto/manual switch to select auto or manual operation in the event of a power failure, as well as a test switch to check if the generator starts automatically.

Battery charger

This unit charges the battery used for starting the generator engine. The battery slowly discharges to supply stand-by power even when the generator is not operating. The battery charger is indispensable, preventing the battery from running down for an emergency generator that is equipped with an auto starting start/stop unit and maintaining a stand-by state at all times in case of emergencies.

The charger uses commercial power to charge the battery while the generator is in a stand-by state.

Model	Auto start/stop unit and charger		Battery charger	
	Built in NES unit	Separate board	Built in NES unit	Separate board
NES25TK, NES25TKLS	—	○	—	○
NES25TKL, NES45, NES60, NES100EI	—	○	○	○
NES100TI2, NES125 - NES800	○	○	○	○

Power switching panel

This panel incorporates a switch to toggle between commercial power and generator output. The design is similar to a distribution board. Various models are available to meet your requirements for voltage, current and indoor/ outdoor use.

Power switching panel
(Conceptual illustration)

Standard size of power switching panel (Indoor type)

Voltage	Current	Dimensions(W×H×D)	Method
200V system	200A	700×1000×300	Wall-mounted
	400A		
	600A	800×1650×500	Free-standing
	800A	800×1850×500

	1200A		
400V system	200A	700×1000×300	Wall-mounted
	400A		
	600A	800×1650×500	Free-standing
	800A	800×1850×500	
	1000A	800×1950×500	
	1200A		

Note: * Please consult with Nippon Sharyo for special requirements such as incorporating an auto start/stop unit in the power switching panel.
* Please consult Nippon Sharyo about outdoor specifications.

Energy-saving remote controller and slowdown device

The energy-saving remote controller and slowdown device remotely control engine operation for better fuel economy. Both are wired remote controllers.

○: Available

Remote control	Energy-saving remote controller	Slowdown device

Energy-saving remote controller

Slowdown device

Fuel tank three-way cock

A single-lever, fuel tank changeover cock for switching between the internal and external tanks is provided to allow for long time operation. The cock is easy to operate and prevents mistakes switching.

(Provided as standard equipment on **NES25** to **NES300** and as an option for **NES400** to **NES800**; not available for **NES25TKL**, **NES25TKLS**, **NES45TYL3**, and **NES60TKL2**.)

▲ Three-way cock of fuel tank (standard)

▲ **NES400** and later (optional)
